

Identified Bugs:

1. Form Method in HTML:

Bug: The form method in the HTML file was set to the default (**GET**), causing the form to submit a **GET** request instead of the required **POST** request.

Resolution: Updated the form tag in the HTML file to use `method="post"`.

2. Flask Request Handling:

Bug: In the Flask code, the `request.args.get("note")` was used to retrieve form data, which is incorrect for **POST** requests.

Resolution: Changed the request handling in Flask to use `request.form.get("note")` for accessing form data.

3. Button Type in HTML:

Bug: The button inside the form was missing the `type="submit"` attribute, which is essential for triggering form submission.

Resolution: Added `type="submit"` to the button inside the form in the HTML file.

Summary:

Corrected the form method in the HTML file to **post**.

Modified Flask code to handle both GET and POST requests.

Updated request handling in Flask to use `request.form.get("note")`.

Added **type="submit"** to the button inside the form in the HTML file.
